

Hatched = reported, NOT fixed: relationship edges written by cut turns have no per-turn provenance to delete by (docs/checklist.md). n = 1 scene.

The two arms are DIFFERENT scenes with different floors — read each against its own. Lexical coverage is a FLOOR on recall, not a measure of it. "n/r" = the discounted metric postdates that run and is not imputed (ISSUES.md A-1, A-2). n = 1.

"clean" inverts a raw metric that counts a leak, so every bar reads the same way. n = 1 scene per probe per arm.
